

PILE POST

Enabling strong quick-clamping connection to the top of steel piles for excavation protection

The Pile Post has been designed to rigidly connect to the end of most typical steel piles and allow for guardrails and fence to be installed easily and safely around the perimeter of open excavations

FAST. SIMPLE. SAFE.

The Pile Post has been tested and verified for use on a wide range of the most common pile sections.

The bracket is easily installed on the pile flange and extends 4'-0" (typical) or 8'-0" (extended) and allows for scaffold tube rails and fencing to provide continuous protection around your excavation.
